In linear algebra, the singular-value decomposition (SVD) is a factorization of a real or complex matrix. It is the generalization of the eigendecomposition of a positive semidefinite normal matrix (for example, a symmetric matrix with positive eigenvalues) to any \tilde{A} — matrix via an extension of the polar decomposition. It has many useful applications in signal processing and statistics.

to analyze², and in itself adds no information to the analysis. However, for a noise signal to carry no information, it must be white with a flat spectrum and an autocorrelation function (ACF) equal to an impulse³. Most real noise is not really white, but colored in some respect. In fact, the term noise is often used rather loosely and is frequently used to describe signal contamination.

The electron is a subatomic particle, symbol e^- or \hat{e}^- , whose electric charge is negative one elementary charge. Electrons belong to the first generation of the lepton particle family, and are generally thought to be elementary particles because they have no known components or substructure. The electron has a mass that is approximately 1/1836 that of the proton.
